

ERICSSON

ERICSSON LTE EXPERIENCES 3.5 GHz BAND

LTE SUBSCRIPTIONS

1H 2014 298 012 134

3400 – 3600 MHz AND 3600 – 3800 MHz ARRANGEMENTS IN EUROPE

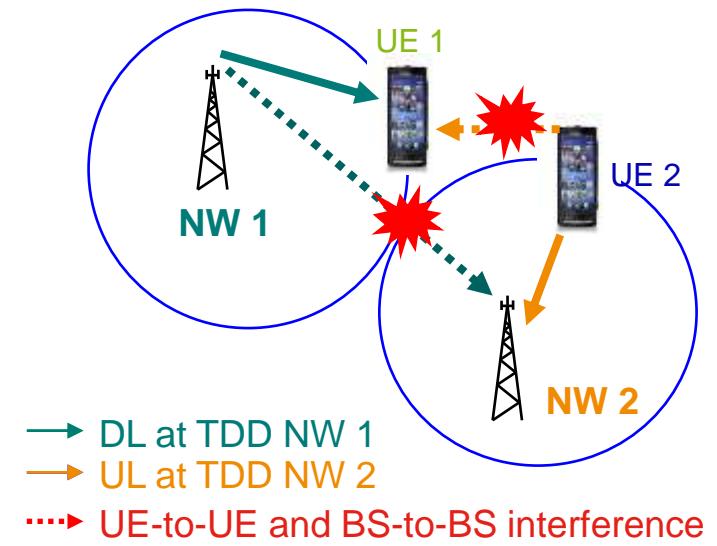

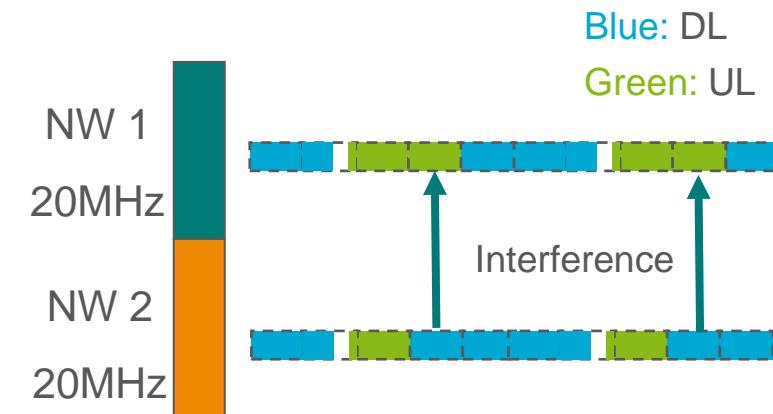

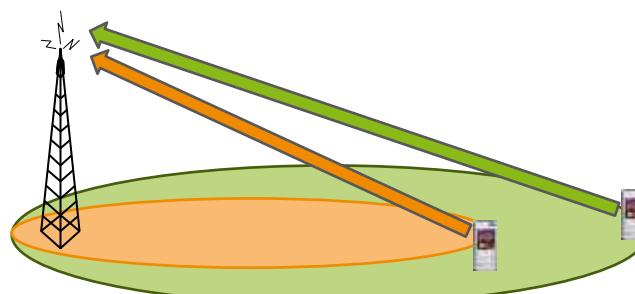

- › FDD Alternative recognized by European operators.
- › Orange France: 3.5 GHz FDD trial
<http://vimeopro.com/warmuprod/35-ghz-fdd>

TDD DRAWBACKS

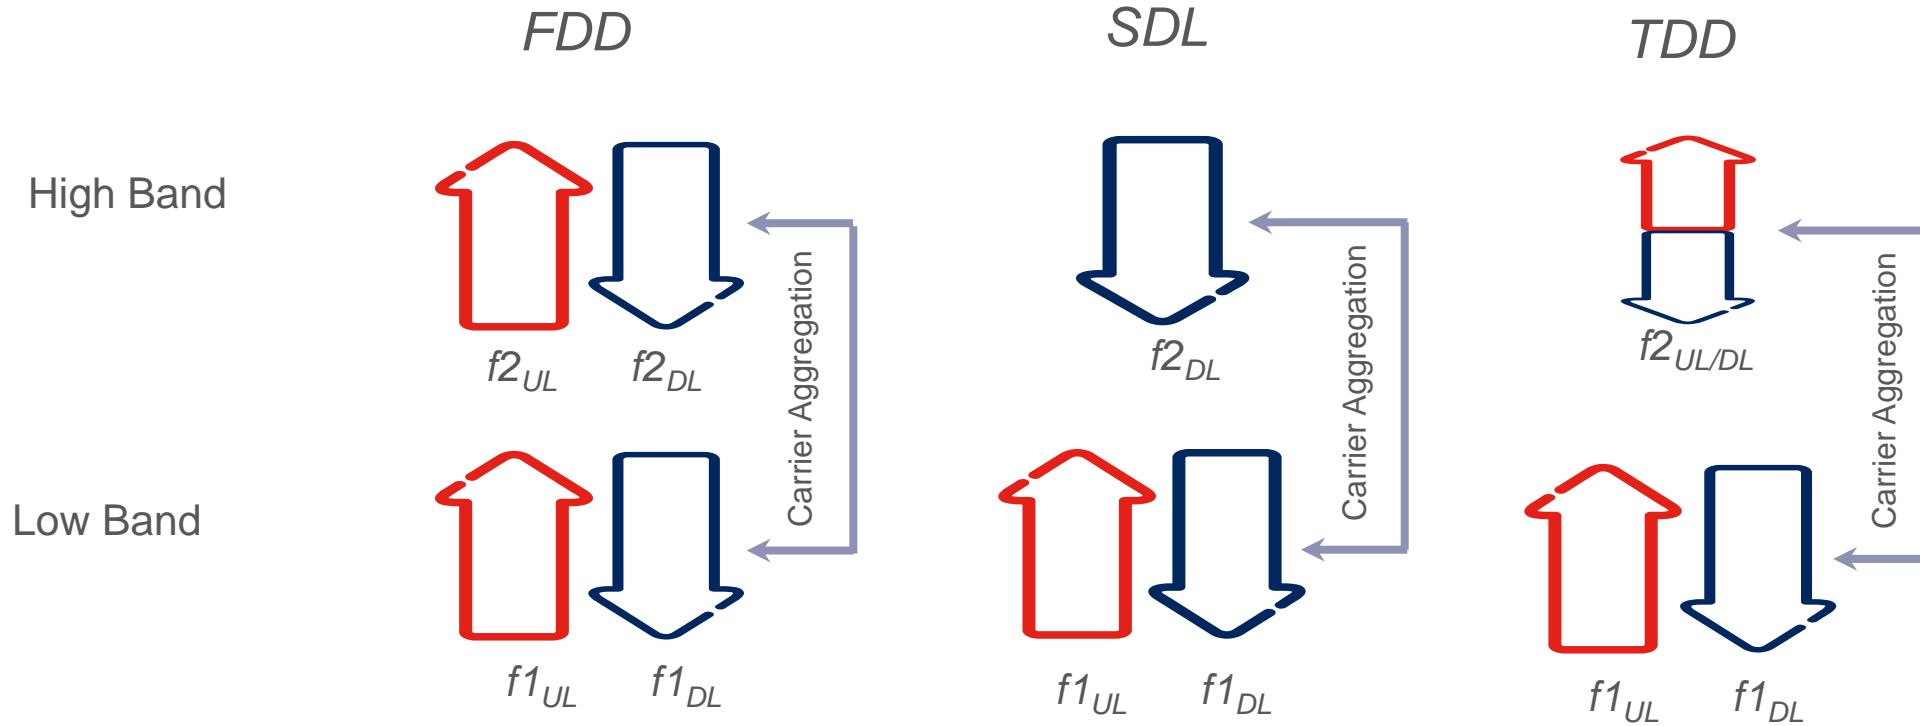

- › Peak rates for TDD (config 2) are lower than for FDD
- › Time domain co-ordination necessary for two TDD networks at same frequency band
- › Synchronize networks and use same UL/DL configuration
- › TDD puts higher requirements on eNodeB synchronisation than FDD
- › TDD (config 2) UL app coverage -7 dB worse than FDD at same frequency (~20% less effective average UE Tx power at cell-edge)

SUPPLEMENTARY DOWNLINK – SDL

Many operators in 3GPP are discussing LTE FDD+TDD
Carrier Aggregation using TDD as **DL only band**

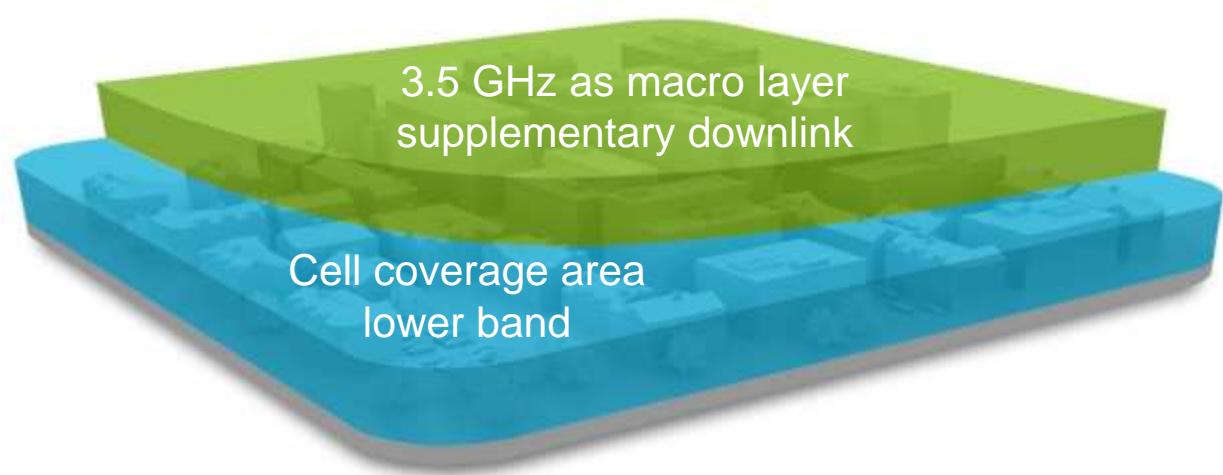

SDL: CA with LTE FDD DL in unpaired spectrum
App coverage improved in DL, maintained in UL

3.5 GHz WITH SDL & ASA

Inter Site Distance	Users covered by 3.5 GHz
300 m	100%
500 m	96%
700 m	92%

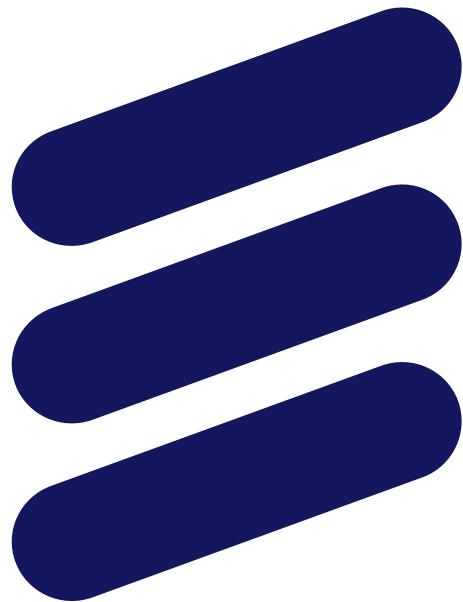

› Worlds first Supplementary Downlink (SDL) on LTE

- Demonstrating 10 MHz FDD on Band 4 with 10 MHz downlink only on 3.5 GHz
- Supplementary downlink an option for maximum performance in unpaired carriers

› 3.5 GHz band valuable for MBB

- For adding macro network capacity
- For hot spot fill in with small cells
- Authorized Shared Access (ASA) open up spectrum in some markets

Ericsson offer a complete 3.5 GHz portfolio,
macros to small cells, TDD and FDD
